>> LEADING EDGE X-RAY SECURITY TECHNOLOGY

The mobile cabinet-style unit can be quickly set up as a security inspection station and moved to other locations as required. Once the FlatScan-POD is in position, the FlatScan-TPXi system is simply slotted into the unit ready to inspect bags. The unit is battery operated so it's deployment is not limited by access to mains electricity.

If a stray suspect item is found in the vicinity the FlatScan-TPXi unit can be quickly removed from the FlatScan-POD and deployed as a portable x-ray inspection system to investigate the suspicious item without moving it.

Further advantages of the system in addition to its very large area detector size are the extremely high quality images and range of image processing functions available to enable the operator to make the right call first time every time.
